Description of the Normative Sample

The normative sample (*N*=1569; Table 1) used to normalize data from NeuroTrax mild tests (previously known as MindStreams tests) ranges through old age and includes individuals with a variety of educational levels. The age distribution is bimodal, with the largest number of individuals between 20-30 and 70-80 years old. The education distribution approximates a normal curve, with a mean of 14.4 and a standard deviation of 3.2; the largest number of individuals have 12-15 years of education.

Table 1. Demographic Characteristics of the NeuroTrax Normative Sample (*N*=1569)[1]

Age (years)	
≤18	8 %
>18 and ≤30	22 %
>30 and ≤40	6 %
>40 and ≤50	5 %
>50 and ≤60	11 %
>60 and ≤70	17 %
>70 and ≤80	24 %
>80	7 %
Education (years)*	
≤6	1 %
>6 and ≤9	3 %
>9 and ≤12	29 %
>12 and ≤15	31 %
>15 and ≤18	28 %
>18	8 %
Gender, female	58 %
Handedness, right-handed	94 %
Primary Language	
English	19 %
Spanish	<1 %
Russian	2 %
Hebrew	79 %
Marital Status	
Single	34 %
Married	48 %
Divorced	5 %
Widowed	13 %
Other	<1 %
Supervised Others, yes	40 %
Ethnicity	
White/Caucasian	62 %
African American/Afro-Caribbean	3 %
Middle Eastern	35 %
Other	<1 %
Colorblind, no	98 %
Use Computer, yes	80 %

*in individuals >18 years old

Table 2. Stratifications of the NeuroTrax Normative Sample

Education (Years)	Age (Years)
All	>8.0 - 12.0
	>12.0 - 18.0
≤12	>18.0 - 25.0
	>25.0 - 50.0
	>50.0 - 65.0
	>65.0 - 70.0
	>70.0 - 75.0
	>75.0 - 80.0
	>80.0 - 120.0
>12	>18.0 - 25.0
	>25.0 - 30.0
	>30.0 - 40.0
	>40.0 - 50.0
	>50.0 - 60.0
	>60.0 - 70.0
	>70.0 - 75.0
	>75.0 - 80.0
	>80.0 - 120.0

[1] Database Date: December 5, 2006

To minimize the influence of age and education, and in keeping with standard neuropsychological practice (Strauss et al., 2006; AACN, 2007), the normative sample is stratified according to age and education, and normalization of patient scores is according to the appropriate stratification (Table 2). Normalization occurs automatically with upload of the test results, obviating the need for manual lookup tables and calculation of the normalized scores (see section on Normalization below). For reference purposes, the norms tables used for normalization are available in the NeuroTrax™ Norms Tables module appended to this document.[2]

All individuals in the normative sample were tested in their primary or native language and diagnosed as cognitively healthy (defined by the absence of neurological and psychiatric disease and the absence of mild cognitive impairment). Individuals were diagnosed by experienced clinicians (not by self report) as part of academic research studies using NeuroTrax carried out at a variety of research sites (Table 3). The diagnostic criteria were consistent across sites and determined independently of NeuroTrax scores. Diagnosis considered past medical history and physical examination and was according to accepted clinical criteria (e.g., *DSM-IV*). In many cases, data incorporated into the normative sample included control participants in a study of discriminant validity for a particular condition; in others, the data come from a control group or condition in a study of a therapeutic intervention. Most individuals had only one visit that met the inclusion criteria, and this was generally the first visit (when the 1st alternate form is administered). To allow for representation of all three alternate forms, if multiple visits for the same individual met the inclusion criteria, data from a visit with the highest alternate form number (1 to 3) were included.

Relationship with Demographic Variables

As detailed below, when normalized according to stratifications of age and education (Table 2), little to none of the variance in outcome parameter scores for individuals in the NeuroTrax normative sample is explained by age, education, gender computer use, and testing language. Also, little to none of the variance is explained by alternate form number. Thus no additional modeling or covariates are used when comparing examinee data to the normative data.

Age

Of the 113 raw (not normalized for age and education) outcome parameters (12 available in Excel data exports but not on the clinical Data Report) computed for NeuroTrax mild tests, age explains more than 10% of the variance in 60 of them, more than 20% of the variance in 32 of them, more than 30% of the variance in 14 of them, and more than 40% of the variance in 5 of them, with a maximum of 51% of the variance explained by age for the composite score from the 'No Interference: Letter Color' level of the Stroop Interference test and (average) time to make 1st move on the Catch Game (Table 4; NeuroTrax™ Normative Scatterplots module).

When the outcome parameters are normalized according to stratifications of age and education (Table 2), age explains 0% of the variance in all 113 outcome parameters (Table 4), reflecting the effectiveness of the normalization procedure in eliminating the influence of age.

Education

Relative to age, education (in individuals >18 years of age) explains a much smaller proportion of the variance in raw (not normalized for age and education) outcome parameters, with education explaining more than 5% of the variance in only 3 outcome parameters and more than 10% of the variance in 1 outcome parameter – accuracy on the Problem Solving test of non-verbal IQ, with 11% of the variance explained by education (Table 5; NeuroTrax™ Normative Scatterplots module).

When the outcome parameters are normalized according to age and education (Table 2), education explains 0% of the variance in all 113 outcome parameters (Table 5), reflecting the effectiveness of the normalization procedure in eliminating the influence of education.

Gender

Like education, gender explains a minimal proportion of the variance in raw (not normalized for age and education) outcome parameters, with gender explaining more than 5% of the variance in only 4 outcome parameters, with a maximum 6% of the variance explained by gender for (average) time to make 1st move on the Catch Game (Table 6).

When the outcome parameters are normalized according to age and education (Table 2), gender continues to explain more than 5% of the variance in 4 outcome parameters, now with a maximum of 9% of the variance explained by gender for (average) time to make 1st move on the Catch Game (Table 6).

Computer Use

Whether or not the individual is a computer user explains more than 5% of the variance in 63 raw (not normalized for age and education) outcome parameters (61 using the adjusted R-squared), more than 10% of the variance in 26 outcome parameters (25 using the adjusted R-squared), and more than 20% of the variance in 4 outcome parameters, with a maximum of 22% of the variance explained by computer use for (average) time to make 1st move on the Catch Game (Table 7).

When the outcome parameters are normalized according to age and education (Table 2), computer use explains 0% of the variance in all 113 outcome parameters (Table 7), indicating that this normalization procedure effectively eliminates the influence of computer use.

Test Language

Test language explains a negligible proportion of the variance in raw (not normalized for age and education) outcome parameters, with test language explaining <5% of the variance in all 113 outcome parameters, with a maximum of 4% of the variance explained by test language for matching accuracy on the Verbal Function test (Table 8).

When the outcome parameters are normalized according to age and education (Table 2), test language continues to explain a negligible portion of the variance, with test language explaining <5% of the variance in all outcome parameters, now with a maximum of 2% of the variance explained by test language for matching accuracy on the Verbal Function test (Table 8).

Alternate Form Number

Alternate form number (1 to 3) explains more than 5% of the variance in only 7 raw (not normalized for age and education) outcome parameters (6 using the adjusted R-squared) and more than 10% of the variance in 2 outcome parameters, with a maximum of 13% (12% using the adjusted R-squared) of the variance explained by alternate form for the composite score from the '2-Digit Arithmetic, Fast Speed' level of the Staged Information Processing Speed test (Table 9).

When the outcome parameters are normalized according to age and education (Table 2) using the normative sample with representation of all three alternate forms, alternate form explains more than 5% of the variance in 3 outcome parameters (2 using the adjusted R-squared) and more than 10% of the variance in 0 outcome parameters, now with a maximum of 8% of the variance explained by alternate form for composite score from the '2-Digit Arithmetic, Fast Speed' level of the Staged Information Processing Speed test (Table 9).

The small proportion of variance explained by alternate form is consistent with the good alternate form test-retest reliability shown for NeuroTrax summary scores (Schweiger et al., 2003; Melton, 2005), which are computed from normalized outcome parameters (see Product Guide).

With regard to outcome parameter variability, education, gender, computer use, test language, and alternate form number explain <5% of the variance in outcome parameter variability (i.e., |X-100|) for all 113 normalized outcome parameters. Age explains more than 5% of the variance in only 2 outcome parameters, with a maximum of 7% of the variance explained for accuracy on the fourth immediate repetition of the Non-Verbal Memory test.

Table 4. R-squared Values for Linear Regressions with Age for Raw + Normalized Outcome Parameters for Individuals in the NeuroTrax Normative Database (*N*=1569)

		R-squared: Age		Adjusted R-squared Age

[a] Form 1: *N*=1384; Form 2: *N*=125; Form 3: *N*=60.

[b] supplemented by additional data (*N*=54) for ages >40.0 to 70.0 collected as of August 13, 2010 to achieve the minimum requisite sample size for the relevant normative stratifications (see NeuroTrax™ Norms Tables module for details).

*available only in the Excel data exports but not on the clinical Data Report.

Norms Tables

The NeuroTrax™ Norms Tables module appended to this document contains sample statistics for each (raw) outcome parameter recorded for NeuroTrax™ mild tests, subdivided by each of the 18 age/education stratifications of the NeuroTrax normative database dated December 5, 2006 (total *N*: 1569).[2] Statistics include the sample size (*N*), mean, standard deviation (SD), lower quartile, median, upper quartile and range, as well as skewness and kurtosis. The means and standard deviations are the values used by the NeuroTrax system to automatically compute age- and education-adjusted normalized scores that appear on the clinical Data Report and in the Excel data export files provided for research purposes.

Normalization (Standardization)

Computation of the normalized scores, which occurs automatically when NeuroTrax raw test scores are uploaded, is according to the standardization procedure typically used to score neuropsychological tests whereby the normative mean and SD are used to a compute a z-score. To ease interpretability, the *z*-score is then scaled to an "IQ-style" scale. The result is a normalized score where 100 is equivalent to the mean of normative mean for the relevant age/education stratification, and 15 units corresponds to 1SD.

Computation of Normalized Score for an Individual Scoring 1 Standard Deviation Below the Mean

Score	Formula	Example (*X* = 87, *M* = 94, *SD* = 7)
z-score	(*X*-*M*)/*SD*	(87-94)/7 = (-7)/7 = -1
"IQ-style" score	15*z*+100	15(-1)+100 = (-15)+100 = 85

X = raw outcome parameter score

M = mean for appropriate stratification of the normative sample

SD = standard deviation for the appropriate stratification of the normative sample

The table above illustrates the normalization process for a 67-year old patient with 15 years of education who received a raw accuracy of 87% on the NeuroTrax Go-NoGo Response Inhibition test. For the patient's age/education stratification, the normative mean for the Go-NoGo accuracy outcome parameter is 94%, and the standard deviation is 7%. To calculate the *z*-score, the difference between the patient's score (87%) and the normative mean is divided by the normative standard deviation. Given that the standard deviation is 7 and the patient scored 7 points below the normative mean, the patient scored 1 standard deviation below the mean, which is equivalent to a z-score of -1. The *z*-score is then transformed into an IQ-score via multiplication by 15 and addition of 100.

External Validation

In an external validation analysis, normalized outcome parameter scores were computed for a sample of cognitively healthy research participants (*N*=352; mean age ± SD: 49.8 ± 22.4 years; mean education ± SD: 15.2 ± 3.7 years; 226 female) not included in the normative sample who completed the Global Assessment Battery (a battery containing all mild tests but the Expanded Go-NoGo test). Means and SDs for the normalized outcome parameters in the external validation sample are shown in Table 10. Given that individuals in the validation sample are cognitively healthy, their mean normalized scores should approximate 100 and their SD should approximate

15. Indeed, for all outcome parameters, the mean normalized score is within ±5 points of 100 (range: 95.8-102.6), and the SD is within ±5 points of 15 (range: 14.0-18.8).

Table 10. Means and Standard Deviations (SDs) for Normalized Outcome Parameters Computed for Cognitively Healthy Research Participants (*N*=352) Not Included in the NeuroTrax Normative Database[a]

Norms Tables

Prepared By:

Glen M. Doniger, PhD
Director of Scientific Development

NeuroTrax™
Innovative Science for Brain Health

About the Norms Tables

For each (raw) outcome parameter recorded for NeuroTrax™ mild tests (previously known as MindStreams tests), the tables below contain sample statistics for each of the 18 age/education stratifications of the NeuroTrax normative database dated December 5, 2006 (total *N*: 1569). Statistics include the sample size (*N*), mean, standard deviation (SD), lower quartile, median, upper quartile and range, as well as skewness and kurtosis. The means and standard deviations are the values used by the NeuroTrax system to automatically compute age- and education-adjusted normalized scores that appear on the clinical Data Report and in the Excel data export files provided for research purposes. The lower and upper quartile values are computed as a weighted average using definition 1.

For individuals through age 18, NeuroTrax normative data is stratified only by age. For individuals over age 18, the norms are stratified by education (≤12 years or >12 years) as well as age.

Above each table, the name of the test and the outcome parameter is given, followed by the units of measurement (in parentheses), the code associated with the outcome parameter in the NeuroTrax data export legend (in brackets), and an arrow indicating whether a higher (🡅) or lower (🡇) value reflects better performance. Some outcome parameters are available only in the Excel data exports but not on the clinical Data Report. These outcome parameters are indicated by an asterisk.

Adequate sample size per stratification was set at $N \geq 20$. Data for stratifications with insufficient *N* may be combined with data from an adjacent age stratification with the same educational level in order to achieve the minimum requisite sample size. Each such instance is indicated by superscripts in the *N* column, and the details are provided beneath the relevant table. For one test (i.e., the Expanded Go-NoGo test), data in five normative stratifications (rows shaded gray) was supplemented by additional data collected as of August 13, 2010 to achieve the minimum requisite sample size.

Note that the low imputed scores (equivalent to the 1st percentile value of the entire normative database) inserted for tests/test levels with a failed practice session and test levels on the Staged Information Processing Speed test with extremely poor performance have been inserted prior to computing the sample statistics included here.

Norms Tables

Go-NoGo Response Inhibition [1000]

Go-NoGo Response Inhibition: Accuracy (%) [AC10001]

Education (Years)	Age (Years)	*N*	Mean	SD	Lower Quartile	Median	Upper Quartile	Range	Skewness	Kurtosis

NeuroTrax™
Innovative Science for Brain Health

Normative Scatterplots: Age & Education

Prepared By:

Glen M. Doniger, PhD
Director of Scientific Development

NeuroTrax™
Innovative Science for Brain Health

About the Scatterplots

For each (raw) outcome parameter recorded for NeuroTrax™ mild tests (previously known as MindStreams tests), the scatterplots below show the spread of scores over the age (left plots) and education (right plots) ranges for individuals in the NeuroTrax normative database dated December 5, 2006 (total *N*: 1569). Age plots include all individuals. As education generally covaries with age until about age 18, education plots are limited to individuals over age 18. A regression line appears on each scatterplot, and the associated R-squared value is shown to the lower-right of the plot.

Above each table, the name of the test and the outcome parameter is given, followed by the units of measurement (in parentheses), the code associated with the outcome parameter in the NeuroTrax data export legend (in brackets), and an arrow indicating whether a higher (🡅) or lower (🡇) value reflects better performance. Some outcome parameters are available only in the Excel data exports but not on the clinical Data Report. These outcome parameters are indicated by an asterisk.

Although the *x*-axis for age plots begins at 0 for better visualization, the youngest individual in the database is 8.02 years of age. In some cases, the *y*-axis has been truncated to exclude outliers and improve visualization of the data. However, regression lines and R-squared values were computed from all data.

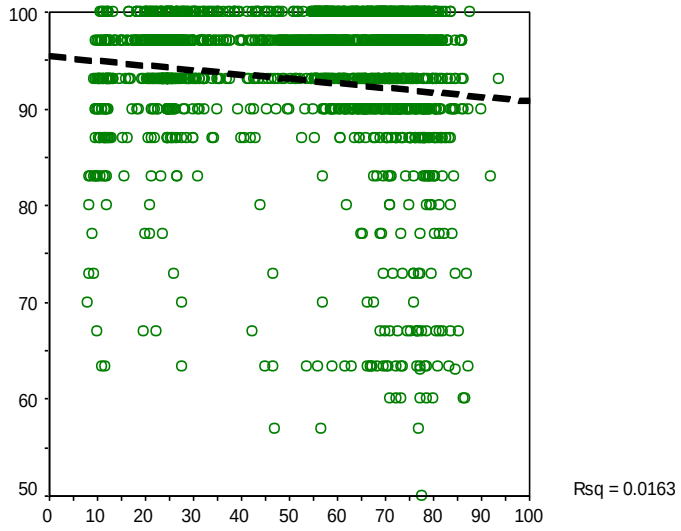
For one test (i.e., the Expanded Go-NoGo test), data for ages >40.0 to 70.0 was supplemented by additional data collected as of August 13, 2010 to achieve the minimum requisite sample size for the relevant normative stratifications (see NeuroTrax™ Norms Tables module for details).

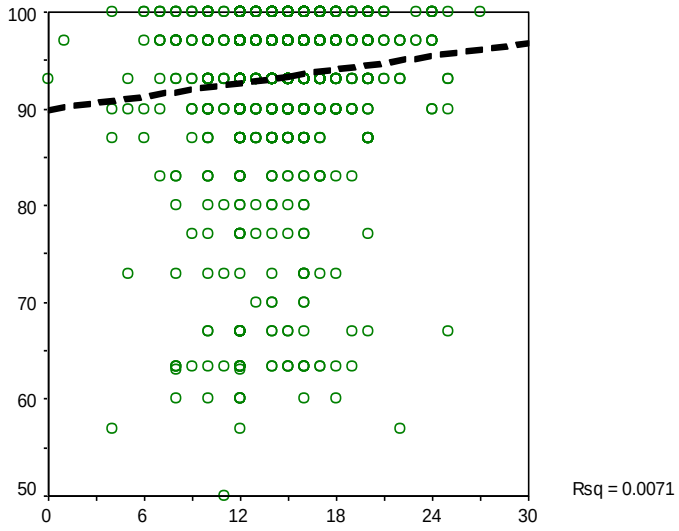
Note that the low imputed scores (equivalent to the 1st percentile value of the entire normative database) inserted for tests/test levels with a failed practice session and test levels on the Staged Information Processing Speed test with extremely poor performance have been inserted prior to generating these plots.

Normative Scatterplots

Go-NoGo Response Inhibition [1000]

Go-NoGo Response Inhibition: Accuracy (%) [AC10001]





Go-NoGo Response Inhibition: (Average) Response Time (ms) [RT10001]
